#### **DETAILED ACTION**

1. The Applicant Response dated October 17, 2006 to an Office Action dated August 24, 2006 is entered. Claims 1-19 and 21 are pending in this application.

#### Response to Amendment

2. Applicant's arguments with respect to claims 1-19 and 21 have been considered but are most in view of the new ground(s) of rejection. The rejections are necessitated due to claim amendments and addition of new claim.

### Claim Rejections - 35 USC § 101

3. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claim 21 is rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. The claimed "computer-readable medium having computer-readable data" does not by itself perform the claimed steps of allowing, receiving, converting and translating. The computer-readable data in the form of executable instructions when executed on a computer cause these steps to be performed.

#### Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

Art Unit: 2614

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claim 21 is rejected under 35 U.S.C. 102(e) as being anticipated by Saleh (US Patent No. 6,654,458 B1).

Regarding claim 21, Saleh discloses a computer-readable medium (Fig. 1, item 30) having computer-readable data (col. 3, II. 3-4, set of programming instructions) to allow a party to a call to interact with a network management engine (Fig. 1, item 16, PBX/ACD providing management of agents; col. 4, II. 5-58),

to receive a user input from the party and to convert the user input directive into a directive for the network management engine (col. 4, II. 59-col. 5, II. 30; col. 6, II. 28-47; supervisor's input converted to command to perform action), and

to translate at least a portion of a first signal representing network information into a second signal representing an audible sound (col. 5, II. 38-52; converting status information to audible response to supervisor).

## Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2614

7. Claims 11-12, 14, 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saleh (US Patent No. 6,654,458 B1), and further in view of Barnes (US Patent No. 6,594,470 B1).

Regarding claim 11, Saleh teaches of a monitoring method comprising:

communicatively coupling a voice call to management engine (Fig. 1, item 16, PBX/ACD providing management of agents) by a caller response unit (Fig. 1, item 24) associated with a multi-modal administration engine (col. 2, II. 66-col. 3, II. 28; PBX/ACD allowing the request and response through multiple modes i.e. telephone calls, email, or website of the organization);

recognizing that a party can receive audible information via the call (col. 2, II. 60-65, ANI as caller identity) and graphical information via a data connection (col. 3, II. 5-14, a return email address or caller includes his URL address, these are Internet addresses and Internet is a data network);

receiving a spoken directive from a party to the call (col. 5, II. 13-21);

converting the spoken directive into a directive for the network management engine by the caller response unit (col. 4, II. 5-col. 5, II. 30); and

translating at least a portion of a first signal representing network information into a second signal representing an audible sound by a format converter associated with the multi-modal administration engine (col. 5, II. 38-52; converting status information to audible response to supervisor. Format converter as disclosed by the instant application is text-to-speech translator that is similar to Saleh's VRU 24. Also, Saleh's supervisory

Art Unit: 2614

application 40 is similar to format converter being part of another device as disclosed by the instant application).

Saleh does not call PBX as network management engine.

However, in the same field of endeavor, Barnes teaches of a method wherein call center server (Fig. 1, item 108) monitors and manages various agent workstations connected through network (col. 3, II. 43-52) and this monitoring and managing is controlled and directed remotely by call center supervisor using a wireless device that includes graphical, text and audible interface (col. 3, II. 66-col. 4, II. 63).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Saleh to include call center server to manage resources attached to the network as taught by Barnes in order to manage geographically distributed agent workstations which is becoming a common configuration of call center with agents working from home.

**Regarding claim 12,** Saleh teaches of asking for a password from a caller and caller presenting his name and password to access the system (col. 4, II. 43-54).

Regarding claim 14, Saleh teaches of the method, further comprising:

receiving a response from a software agent associated with the monitored network device (col. 6, II. 44-46);

converting the response into a spoken response (col. 5, ll. 45-46); and playing the spoken response to the party (col. 5, ll. 51-52).

Regarding claim 16, Saleh teaches of a method, further comprising:

Art Unit: 2614

receiving a keyed in directive from the party, the keyed in directive comprising dual tone multi-frequency signals (col. 4, II. 52-54).

**Regarding claim 17,** Barnes teaches of a method of using TCP/IP protocol for an interface to mobile radio terminals (col. 6, II. 23-26).

8. Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over Saleh modified by Barnes as applied to claim 11 above, and further in view of Linzy (US Patent Application Publication No. 2002/0019866 A1).

Regarding claim 13, Saleh modified by Barnes does not teach SNMP protocol.

However, in the same field of endeavor, Linzy teaches of using SNMP protocol for monitoring and maintaining communication network (Paragraph 0032).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Saleh modified by Barnes to use SNMP protocol as taught by Linzy in order to be compatible with multiple vendor supplied devices using a industry standard management protocol.

9. Claims 15, 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Saleh modified by Barnes as applied to claim 11 above, and further in view of Metcalf (US Patent Application Publication No. 2002/0122541 A1).

Regarding claim 15, Saleh teaches of a supervisory application receiving response from monitored network device (ACD) control application (the supervisory interface application 40 may reside on one of the supervisor's terminal and remotely

Art Unit: 2614

access ACD control applications 42, 44 (device agents) (col. 4, II. 5-12). The application 40 functions to access the related application 42, 44 and make the requested changes (col. 5, II. 32-34). The proper applications convert the command into format, which the CPU 28 can execute. The command is sent to the CPU 28 (by the control application) and the CPU confirms execution of the change (results to requesting application, in this case control application) (col. 6, II. 37-42). It is known in the art that CPU is merely a hardware that executes one instruction at a time given to it by software application, in this case the control application, and the application causing the instruction execution checks the result of execution. Thus control application receives the result of the execution and responds to the remote supervisory interface application that originally requested function command execution. Thus, Saleh teaches of supervisory application remotely receiving response from the software agent (monitored device control application) associated with a network device (ACD));

converting this response to audible information (col. 5, II. 46-47, II. 50-52); and routing this portion to the party (supervisor) via the call.

Saleh modified by Barnes is silent on separating response information in audible and graphical information.

However, in the same field of endeavor, Metcalf teaches of converting network information to speech routed via a call (paragraph 0058) and to data routed as GUI or Web via data connection to browsers (Internet Explorer or Netscape Navigator) on user's computer terminal (Paragraphs 0056, 0059).

Art Unit: 2614

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Saleh modified by Barnes to include graphical user functionality as taught by Metcalf in order to provide content in visual display (Metcalf, Paragraph 0056) in addition to playing the content audibly to a user in the course of the call (Metcalf, Paragraphs 0058, 0059, 0079).

**Regarding claim 19,** Saleh modified by Barnes does not teach of a method, further comprising:

decoupling the voice call from the network management engine, and receiving an additional directive originating from an input device coupled to computing platform comprising the network management engine.

However, in the same field of endeavor, Metcalf teaches of decoupling a call from network server (Paragraph 0066) and receiving additional directive originating from input device (user computer terminal that was originally connected and which originally displayed a number for the party to initiate the call, Paragraph 0059) coupled to a computing platform (network server 106) representing the network management engine.

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Saleh modified by Barnes to include the decupling of a call from network server as taught by Metcalf in order to save resources by freeing up dedicated resource used by the call and continue monitoring with original web browser session.

Art Unit: 2614

10. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Saleh modified by Barnes as applied to claim 11 above, and further in view of McDuff (US Patent No. 6,490,350 B2).

Regarding claim 18, Saleh modified by Barnes does not specifically teach of a method comprising initiating communication to the party of information representing a graphical user interface that displays a visual representation of a network monitored by the network management engine.

However, in the same field of endeavor, McDuff teaches of a method initiating communication to a party (col. 5, II. 12-17, II. 49-54, change in status of monitored element i.e. agent generates an event and the communication of this event is *initiated* by the system and sent to the monitoring system client i.e. party who has permanent request for status information) of information representing a graphical user interface that displays a visual representation of a call center monitored by the monitoring server (Fig. 13, col. 2, II. 47-49, col. 11, II. 40-64).

It would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify Saleh modified by Barnes to include the use of graphical user interface for representation of information as taught by McDuff in order to provide visual status of the network being monitored.

### Allowable Subject Matter

11. Claims 1-10 are allowed.

Claims 1-10, the reasons for allowance are same as discussed in previous office action.

#### Conclusion

12. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hemant Patel whose telephone number is 571-272-8620. The examiner can normally be reached on 8:00 AM - 5:00 PM.

Application/Control Number: 10/644,260 Page 11

Art Unit: 2614

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Fan Tsang can be reached on 571-272-7547. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
